Continuous positive airway pressure devices for the treatment of obstructive sleep apnoea–hypopnoea syndrome: a systematic review and economic analysis

C McDaid, S Griffin, H Weatherly,
K Durée, M van der Burgt, S van Hout,
J Akers, RJO Davies, M Sculpher and
M Westwood 

January 2009
DOI: 10.3310/hta13040

Health Technology Assessment
NIHR HTA Programme
www.hta.ac.uk

How to obtain copies of this and other HTA Programme reports.

An electronic version of this publication, in Adobe Acrobat format, is available for downloading free of charge for personal use from the HTA website (www.hta.ac.uk). A fully searchable CD-ROM is also available (see below).

Printed copies of HTA monographs cost £20 each (post and packing free in the UK) to both public **and** private sector purchasers from our Despatch Agents.

Non-UK purchasers will have to pay a small fee for post and packing. For European countries the cost is £2 per monograph and for the rest of the world £3 per monograph.

You can order HTA monographs from our Despatch Agents:

- fax (with **credit card** or **official purchase order**)
- post (with **credit card** or **official purchase order** or **cheque**)
- phone during office hours (**credit card** only).

Additionally the HTA website allows you **either** to pay securely by credit card **or** to print out your order and then post or fax it.

Contact details are as follows:

HTA Despatch
c/o Direct Mail Works Ltd
4 Oakwood Business Centre
Downley, HAVANT PO9 2NP, UK

Email: orders@hta.ac.uk
Tel: 02392 492 000
Fax: 02392 478 555
Fax from outside the UK: +44 2392 478 555

NHS libraries can subscribe free of charge. Public libraries can subscribe at a very reduced cost of £100 for each volume (normally comprising 30–40 titles). The commercial subscription rate is £300 per volume. Please see our website for details. Subscriptions can be purchased only for the current or forthcoming volume.

Payment methods

Paying by cheque

If you pay by cheque, the cheque must be in **pounds sterling**, made payable to *Direct Mail Works Ltd* and drawn on a bank with a UK address.

Paying by credit card

The following cards are accepted by phone, fax, post or via the website ordering pages: Delta, Eurocard, Mastercard, Solo, Switch and Visa. We advise against sending credit card details in a plain email.

Paying by official purchase order

You can post or fax these, but they must be from public bodies (i.e. NHS or universities) within the UK. We cannot at present accept purchase orders from commercial companies or from outside the UK.

How do I get a copy of HTA on CD?

Please use the form on the HTA website (www.hta.ac.uk/htacd.htm). Or contact Direct Mail Works (see contact details above) by email, post, fax or phone. *HTA on CD* is currently free of charge worldwide.

The website also provides information about the HTA Programme and lists the membership of the various committees.

Appendix I

Literature search strategies

Searches for systematic reviews and guidelines

Cochrane Database of Systematic Reviews (Cochrane Library 2006, issue 3) (www.thecochranelibrary.com)

Searched 17 October 2006. The 53 records retrieved were scanned to remove references to infants and children and 11 records were downloaded.

1. MeSH descriptor Sleep Apnea Syndromes explode all trees
2. apnea or apnoea
3. hypopnea or hypopnoea
4. hypoapnea or hypoapnoea
5. "sahs" or "shs" or "osas" or "osa"
6. (#1 OR #2 OR #3 OR #4 OR #5)
7. MeSH descriptor Positive-Pressure Respiration explode all trees
8. cpap or apap or ncpap or autocpap or auto-cpap
9. positive near3 airway near3 pressure
10. (#7 OR #8 OR #9)
11. (#6 AND #10)

Database of Abstracts of Reviews of Effects (CRD administration database)

Searched 17 October 2006. Sixty-six records were retrieved.

1. s apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea
2. s sahs or shs or osas or osa
3. s s1 or s2
4. s cpap or apap or ncpap or autocpap
5. s positive(3w)airway(3w)pressure
6. s s4 or s5
7. s s3 and s6

Health Technology Assessment Database (CRD administration database)

Searched 17 October 2006. Eight records were retrieved.

1. s apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea
2. s sahs or shs or osas or osa
3. s s1 or s2
4. s cpap or apap or ncpap or autocpap
5. s positive(3w)airway(3w)pressure

6. s s4 or s5
7. s s3 and s6

National Research Register (2006, issue 3) (www.update-software.com/National/)

Searched 17 October 2006. Seventy-seven records were retrieved.

1. SLEEP APNEA SYNDROMES explode all trees (MeSH)
2. (apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea)
3. (sahs or shs or osas or osa)
4. (#1 or #2 or #3)
5. POSITIVE-PRESSURE RESPIRATION explode all trees (MeSH)
6. (cpap or apap or ncpap or autocpap)
7. (positive near airway near pressure)
8. (#5 or #6 or #7)
9. (#4 and #8)

Scottish Intercollegiate Guidelines Network (www.sign.ac.uk)

Searched 17 October 2006. The website was scanned and one record was retrieved.

National Guideline Clearinghouse (www.guideline.gov/)

Searched 17 October 2006. The following search terms were used. The results were scanned and seven records were retrieved.

1. apnea
2. apnoea
3. hypopnea
4. hypopnoea
5. hypoapnea
6. hypoapnoea
7. sahs
8. shs
9. osas
10. osa

Health Services/Technology Assessment Text (HSTAT) (www.ncbi.nlm.nih.gov/books/bv.fcgi?rid=hstat)

Searched 17 October 2006. The following search terms were used. The results were scanned and one record was retrieved.

1. apnea
2. apnoea
3. hypopnea
4. hypopnoea
5. hypoapnea
6. hypoapnoea

Turning Research into Practice Database (Trip) (www.tripdatabase.com/)

Searched 17 October 2006. The following search terms were used. The results were scanned and two records were retrieved.

1. cpap or apap or ncpap or autocpap
2. apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea

Health Evidence Bulletins Wales (<http://hebw.cf.ac.uk/index.html>)

Searched 17 October 2006. The website was scanned and no records were retrieved.

Clinical Evidence (www.clinicalevidence.com)

Searched 17 October 2006. Chapters were scanned online and eight records were retrieved.

National Library for Health Guidelines Finder (www.library.nhs.uk/guidelinesfinder/)

Searched 20 October 2006. One record was retrieved.

1. apnea or apnoea
2. hypopnoea or hypopnea
3. hypoapnea or hypoapnoea

Searches for trials

MEDLINE (1966 to November week 3 2006) (OVID)

Searched 29 November 2006. 2346 records were retrieved.

1. exp sleep apnea syndromes/

Science Citation Index (1900 to 25 November 2006) (Web of Knowledge)

Searched 29 November 2006. 2745 records were retrieved.

1. TS = (apnea or apnoea)
2. TS = (hypopnea or hypopnoea)

3. TS = (hypoapnea or hypoapnoea)
4. TS = "sleep disordered breathing"
5. TS = (sahs or shs or osa or osas or osahs)
6. #1 or #2 or #3 or #4 or #5
7. TS = (positive same airway same pressure)
8. TS = (cpap or ncpap or apap or bipap)
9. TS = ("c pap" or "nc pap" or "bi pap")
10. TS = autocpap
11. #7 or #8 or #9 or #10
12. #6 and #11

ISI Proceedings Science & Technology (1990 to 25 November 2006) (Web of Knowledge)

Searched 29 November 2006. 407 records were retrieved.

1. TS = (apnea or apnoea)
2. TS = (hypopnea or hypopnoea)
3. TS = (hypoapnea or hypoapnoea)
4. TS = "sleep disordered breathing"
5. TS = (sahs or shs or osa or osas or osahs)
6. #1 or #2 or #3 or #4 or #5
7. TS = (positive same airway same pressure)
8. TS = (cpap or ncpap or apap or bipap)
9. TS = ("c pap" or "nc pap" or "bi pap")
10. TS = autocpap
11. #7 or #8 or #9 or #10
12. #6 and #11

Zetoc Conferences (1993 to 29 November 2006) (<http://zetoc.mimas.ac.uk/>)

Searched 29 November 2006. 113 records were retrieved.

1. conference: autocpap
2. conference: bi pap
3. conference: c pap
4. conference: nc pap
5. conference: bipap
6. conference: apap
7. conference: ncpap
8. conference: cpap
9. conference: positive airway pressure

The records retrieved from this search in Zetoc were loaded into an endnote library and duplicates were removed. The following search was then carried out within that endnote library:

1. apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea
2. sleep or sahs or shs or osa or osas or osahs

SIGLE (1980 to March 2005) (SilverPlatter)

Searched 29 November 2006. Three records were retrieved.

1. (apnea or apnoea) in ti,ab
2. (hypopnea or hypopnoea) in ti,ab
3. (hypoapnea or hypoapnoea) in ti,ab
4. sleep disordered breathing in ti,ab
5. (sleep near2 respirat* disorder*) in ti,ab
6. (sahs or shs or osa or osas or osahs) in ti,ab
7. #1 or #2 or #3 or #4 or #5 or #6
8. (positive near3 airway near3 pressure) in ti,ab
9. (cpap or ncpap or apap or bipap) in ti,ab
10. (c pap or bi pap or nc pap) in ti,ab
11. autocpap in ti,ab
12. #8 or #9 or #10 or #11
13. #7 and #12

Index to Theses (1716 to 16 October 2006) (www.theses.com/)

Searched 29 November 2006.

Fourteen records were retrieved.

1. (apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea or sleep) and (cpap or ncpap or apap or bipap or c pap or bi pap or nc pap or autocpap)
2. (apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea or sleep)and (positive airway pressure)
3. (sahs or shs or osa or osas or osahs) and (cpap or ncpap or apap or bipap or c pap or bi pap or nc pap or autocpap)
4. (sahs or shs or osa or osas or osahs) and (positive airway pressure)

NHS Economic Evaluation Database (NHS EED) (CRD internal administration system)

Searched 1 December 2006. Twenty-four records were retrieved.

1. s apnea or apnoea
2. s hypopnea or hypopnoea
3. s hypoapnea or hypoapnoea
4. s sleep(w)disordered(w)breathing
5. s sleep(2w)respirat\$(w)disorder\$
6. s sahs or shs or osa or osas or osahs
7. s s1 or s2 or s3 or s4 or s5 or s6
8. s positive(3w)airway(3w)pressure
9. s cpap or ncpap or apap or bipap
10. s c(w)pap or bi(w)pap or nc(w)pap
11. s autocpap
12. s s8 or s9 or s10 or s11
13. s s7 and s12

Health Economic Evaluations Database (HEED) (1995 to November 2006) (CD-ROM)

Searched 1 December 2006. Seventeen records were retrieved.

1. ax = apnea or apnoea or hypopnea or hypopnoea or hypoapnea or hypoapnoea
2. ax = sleep and disorder*
3. ax = sahs or shs or osa or osas or osahs
4. cs = 1 or 2 or 3
5. ax = positive and airway and pressure
6. ax = cpap or ncpap or apap or bipap or pap or autocpap
7. cs = 5 or 6
8. cs = 4 and 7

EconLit (1969 to October 2006) (SilverPlatter)

Searched 1 December 2006. No records were retrieved.

1. (apnea or apnoea) in ti,ab
2. (hypopnea or hypopnoea) in ti,ab
3. (hypoapnea or hypoapnoea) in ti,ab
4. sleep disordered breathing in ti,ab
5. (sleep near2 respirat* disorder*) in ti,ab
6. (sahs or shs or osa or osas or osahs) in ti,ab
7. #1 or #2 or #3 or #4 or #5 or #6
8. (positive near3 airway near3 pressure) in ti,ab
9. (cpap or ncpap or apap or bipap) in ti,ab
10. (c pap or bi pap or nc pap) in ti,ab
11. autocpap in ti,ab
12. #8 or #9 or #10 or #11
13. #7 and #12

EconPapers (<http://econpapers.repec.org/>)

Searched 1 December 2006. The search results were scanned and no records were retrieved.

1. apnea
2. apnoea
3. hypopnea
4. hypopnoea
5. hypoapnea
6. hypoapnoea
7. sleep and disorder*

Cost-effectiveness searches

The following databases were searched for economic evaluations of sleep apnoea.

NHS Economic Evaluation Database (NHS EED) (CRD internal administration system)

Searched 13 January 2007. Forty-two records were retrieved.

1. S sleep(w)apn\$
2. S apn\$
3. S hypoapn\$
4. S sleep(w)disordered(w)breathing
5. S sleep(2w)respirat\$(2w)disorder\$
6. S sahs or shs or osa or osas or soahs
7. S s1 or s2 or s3 or s4 or s5 or s6

Health Technology Assessment Database (CRD administration database)

Searched 13 January 2007. Eight records were retrieved.

1. S sleep(w)apn\$
2. S apn\$
3. S hypoapn\$
4. S sleep(w)disordered(w)breathing
5. S sleep(2w)respirat\$(2w)disorder\$
6. S sahs or shs or osa or osas or soahs
7. S s1 or s2 or s3 or s4 or s5 or s6
8. S econom\$or cost\$
9. S s7 and s8

Health Economic Evaluations Database (HEED) (1995 to January 2007) (CD-ROM)

Searched 13 January 2007. Seventy records were retrieved.

1. Apn* or hypoapn*
2. 'Sleep disordered' within 3
3. sahs or shs or osa or osas or soahs

IDEAS (<http://ideas.repec.org>)

Searched 13 January 2007. No records were retrieved.

1. Apnoea or apnea or hypoapnoea or hypoapnea

MEDLINE (1950 to 10 January 2007) (OVID)

Searched 13 January 2007. 494 records were retrieved.

1. exp sleep apnea syndromes/(12843)

Searches to inform the model

All searches were conducted in Ovid MEDLINE.

Traffic accidents and cardiovascular events

The following strategy was used to identify literature linking traffic accidents and cardiovascular events (particularly stroke and coronary heart disease) to sleep apnoea.

MEDLINE (In-Process & Other Non-Indexed Citations and MEDLINE 1950 to Present)

Searched 15 January 2007. The results of set 13 were scanned for epidemiological records and sets of selected records were downloaded.

1. Accidents, Traffic/
2. road accidents.ti,ab.
3. traffic accidents.ti,ab.
4. (stroke or strokes).ti,ab.
5. (chd or cardiovascular disease).ti,ab.
6. exp heart diseases/or exp vascular diseases/
7. exp Cerebrovascular Accident/
8. or/1-7

Rates of road accidents

Searches for recent studies on rates of road accidents were undertaken using the strategy described by Ayas and colleagues in their meta-analysis of all studies that examined RTA rates in patients with OSAHS before and after CPAP.¹²² Ayas *et al.* reported their search as follows: 'A comprehensive search of MEDLINE (1966 to March 2005) using Ovid was conducted using the following exploded MESH terms: *sleep apnea syndromes AND positive pressure respiration OR continuous positive airway pressure AND automobile driving OR accident.*'

This search was rerun in Ovid MEDLINE (1950 to March week 1 2007) and included searches of in process citations. The search results were limited to those added to MEDLINE after February 2005 to ensure that no records were missed. The correct medical subject heading (MeSH) term ACCIDENTS was used rather than the term ACCIDENT noted by Ayas *et al.*, on the assumption that this was a transcription error in their paper.

Eight new records were identified.

Search for data on life expectancy for individuals who have suffered a stroke

Ovid MEDLINE (Ovid MEDLINE(R) In-Process & Other Non-Indexed Citations and Ovid MEDLINE(R) <1950 to Present>) was searched on 27 April 2007 for a known paper on post-stroke life expectancy by Dennis and Burn.¹⁶⁴ Once identified, the 'Find similar' option was selected and also the citing papers option to identify similar records. After assessing those references for relevance, a series of searches was undertaken and the results in sets 5, 11, 12, 15, 17, 22 and 24 were assessed to identify further relevant studies.

a Does the study look at CPAP/APAP devices, and does the intervention last ≥ 1 week?
b Does the study have relevant comparators (placebo/sham treatment/no treatment or oral devices)?
c Is the study a randomised controlled trial (RCT)?
d Does the study include participants with obstructive sleep apnoea–hypopnoea syndrome (OSAHS), ≥ 16 years old, who do not specifically relate to a population with brain disease, heart failure or chronic airways disease?
e Does the study look at subjective daytime sleepiness, objective daytime sleepiness, subjective health status, blood pressure, apnoea–hypopnoea index (AHI), oxygen desaturation $> 4\%$, driver simulation tests or other psychometric assessments?

Appendix 3

Quality assessment

Source	Was the method used to assign participants to treatment groups or the sequence of treatments really random?	Was treatment allocation concealed?	Were the groups similar at baseline in terms of ESS and AHI?	If not, were adjustments made for differences in baseline characteristics of the treatment groups?	Did the analysis include an intention-to-treat analysis?	Were appropriate methods used to account for missing data in the intention-to-treat analysis?	What proportion of participants was lost to follow-up for the primary outcomes?	Was the study described as blind or double-blind?

✓, yes, meets criteria; X, no, does not meet criteria; ?, unclear whether meets criteria; AHI, apnoea–hypopnoea index; ESS, Epworth Sleepiness Scale; MSLT, Multiple Sleep Latency Test; NA, not applicable; NR, not reported; PASAT, Paced Auditory Serial Addition Task; RDI, respiratory disturbance index; SBP, systolic blood pressure.

a AHI seemed higher in CPAP group although both fell into the severe category. ESS was similar.

b Although pre-sealed, opaque envelopes were used, they were not sequentially numbered.

c The one patient who dropped out was replaced by the next available recruit.

d An unpaired comparison of first treatment assessment period was conducted based on the evidence of carryover for this variable.

e Six dropped out and four completed the study but were dropped from the analysis as polysomnography was conducted at the incorrect time.

Who was blinded?	Studies using sham CPAP as comparator	Was the study parallel design? (sham CPAP)	Were the participants CPAP naïve? (sham CPAP)	Crossover trials	Was an appropriate analysis using paired data performed? (crossover)	Was there a treatment by period interaction? (crossover)

TABLE 53 Summary of neurocognitive outcomes for individual studies

	Baseline	Follow-up 1	Follow-up 2
Benton Visual Retention Test (direction of improvement +): This is a visuospatial memory test composed of 10 geometric designs; each design is exposed for 10 seconds, after which time the subject is required to reproduce the design from memory			
<i>Crossover trials</i>			
Engleman et al., 1994 ⁹⁰	CPAP: NR; OP: NR; both: NR	Data not reported because there was no statistically significant difference between CPAP and oral placebo	
Engleman et al., 1997 ⁹²	CPAP: NR; OP: NR; both: NR	CPAP: 7.3 (SE 0.6); OP: 7.3 (SE 0.6); MD (SD): 0, <i>p</i> -value: ns	
Engleman et al., 1998 ⁹³	CPAP: NR; OP: NR; both: 7.3 (SD 2.3), <i>n</i> = 23	CPAP: 7.7 (SD 1.5); OP: 7.7 (SD 1.7); MD (SD): 0, <i>p</i> -value: ns	
<i>Parallel trials</i>			
^a Lojander et al., 1999 ¹¹³	<i>Correct</i> CPAP: 8.5 (6–10), <i>n</i> = 10; CM: 7 (3–10), <i>n</i> = 17 <i>Delayed</i> CPAP: 4 (4–4), <i>n</i> = 10; CM: 4 (1–4), <i>n</i> = 17 <i>Errors</i> CPAP: 2 (0–9), <i>n</i> = 10; CM: 5 (0–9), <i>n</i> = 17	<i>Correct</i> CPAP: 8.5, <i>n</i> = 10; CM: 7, <i>n</i> = 16; <i>p</i> -value: ns <i>Errors</i> CPAP: 3, <i>n</i> = 10; CM: 5, <i>n</i> = 17; <i>p</i> -value: ns <i>Delayed</i> CPAP: 4, <i>n</i> = 10; CM: 4, <i>n</i> = 17; <i>p</i> -value: ns	<i>Correct</i> CPAP: 9.5, <i>n</i> = 9; CM: 5, <i>n</i> = 12; <i>p</i> -value: ns <i>Errors</i> CPAP: 1, <i>n</i> = 10; CM: 5, <i>n</i> = 17; <i>p</i> -value: ns <i>Delayed</i> CPAP: 4, <i>n</i> = 10; CM: 4, <i>n</i> = 17; <i>p</i> -value: ns
Brief Visuospatial Memory (direction of improvement +): The respondent is briefly shown a number of geometric figures presented on a single page and is asked to reproduce as many figures as possible in their correct location. After a delay, which includes primarily verbal activities, the task is repeated. The respondent is then asked to identify, from 12 figures, which were included in the six geometric figures originally presented. An optional copy trial may be administered.			
<i>Parallel trials</i>			
Norman et al., 1996 ⁷³ (related paper ³⁴¹)	<i>BVM-TR</i> CPAP: 26.4, <i>n</i> = 17; sham CPAP: 26.1, <i>n</i> = 14 <i>BVM-DL</i> CPAP: 10.8, <i>n</i> = 17; sham CPAP: 10.5, <i>n</i> = 14	<i>BVM-TR</i> CPAP: 29.7, <i>n</i> = 17; sham CPAP: 25.7 (SE 0.6); MD (SD): 4, <i>p</i> -value: 0.143 <i>BVM-DL</i> CPAP: 10.7, <i>n</i> = 17; sham CPAP: 9.4, <i>n</i> = 14; MD (SD): 1.3, <i>p</i> -value: 0.138 NB <i>p</i> -value based on treatment × time interaction (three treatment arms)	
Bourdon-Wiersma Test (direction of improvement +, except 'errors'): After scanning a series of rows containing groups of black dots, respondents are asked to strike out all groups of four dots.			
<i>Parallel trials</i>			
^a Lojander et al., 1999 ¹¹³	<i>Marked</i> CPAP: 128 (56–160), <i>n</i> = 10; CM: 120 (62–400), <i>n</i> = 17 <i>Errors</i> CPAP: 11 (1–18), <i>n</i> = 10; CM: 4 (0–44), <i>n</i> = 17	<i>Marked</i> CPAP: 118, <i>n</i> = 10; CM: 111, <i>n</i> = 16; <i>p</i> -value: ns <i>Errors</i> CPAP: 12, <i>n</i> = 10; CM: 4, <i>n</i> = 16; <i>p</i> -value: ns	<i>Marked</i> CPAP: 103, <i>n</i> = 9; CM: 116, <i>n</i> = 12; <i>p</i> -value: ns <i>Errors</i> CPAP: 12, <i>n</i> = 9; CM: 4, <i>n</i> = 12; <i>p</i> -value: ns

TABLE 53 Summary of neurocognitive outcomes for individual studies

	Baseline	Follow-up 1	Follow-up 2
Concentration endurance test (direction of improvement +, except errors): This test of sustained attention and visual scanning consists of 14 lines with 47 characters in each line (each character consists of a letter, 'd' or 'p', marked with one, two, three or four small dashes). The respondent is required to scan the lines and cross out all occurrences of the letter 'd' with two dashes while ignoring all other characters.			
<i>Crossover trials</i>			
Jokic et al., 1999 ¹⁰⁸	<i>Total score</i> Both: 482.3 (SD 38.6), n = 13	<i>Total score</i> CPAP: 532.3 (SD 73.5); CM: 530 (SD 55.6); MD (SD): 2.3, p-value: 2.36	
	<i>% Errors</i> Both: 7.4 (SD 3.1), n = 13	<i>% Errors</i> CPAP: 4.4 (SD 5.4); CM: 4.5 (SD 6.4); MD (SD): -0.1, p-value: 2.82	
Clock face drawing (direction of improvement -): Respondents are asked to draw the face of a clock and then add in a specified time.			
<i>Parallel trials</i>			
^a Lojander et al., 1999 ¹¹³	CPAP: 1 (1-3), n = 10; CM: 1 (1-3), n = 17	CPAP: 1, n = 10; CM: 1, n = 16; p-value: ns (change)	CPAP: 1, n = 9; CM: 2, n = 12; p-value: ns (change)
Copying (direction of improvement -): Respondents are asked to reproduce a set of designs.			
<i>Parallel trials</i>			
^a Lojander et al., 1999 ¹¹³	CPAP: 1 (1-3), n = 10; CM: 2 (1-4)	CPAP: 1, CM: 2; p-value: ns	CPAP: 1, CM: 2; p-value: ns
Complex figure test (direction of improvement +): The subject is required to make a pen/paper copy of a complex figure.			
<i>Parallel trials</i>			
Henke et al., 2001 ⁸⁵	CPAP: NR; sham CPAP: NR	Data presented in graph only; no statistically significant difference between groups at follow-up	
Consonant trigram (direction of improvement +): In this distractor task respondents are asked to count backwards from a given number on hearing/seeing the stimulus item. When signalled to stop counting respondents are asked to report or identify the stimulus item.			
<i>Crossover trials</i>			
Jokic et al., 1999 ¹⁰⁸	<i>3-second delay</i> Both: 12.3 (SD 4.4), n = 13	<i>3-second delay</i> CPAP: 13.2 (SD 1.5); CM other: 13.4 (SD 1.7); MD (SD): -0.2, p-value: 1.86	
	<i>9-second delay</i> Both: 9.8 (SD 2.5), n = 13	<i>9-second delay</i> CPAP: 10.5 (SD 1.5); CM other: 10.2 (SD 2.6); MD (SD): 0.3, p-value: 1.94

Table 54 Test procedures for neurocognitive trials

Study	Time of day	Caffeine/medication	Test order	Environment	Special exclusion criteria	Test-retest
Barbé et al., 2001 ⁸³	NR	Drug intake and alcohol consumption were assessed at each test period	NR	NR	Cognitive deterioration of any cause, illicit drugs or excessive alcohol use	NR
Barnes et al., 2002 ⁸⁹	The NAB was administered three times during the day of the MSLT and a mean score was computed to account for time of day effects. Other NC tests were only administered during the first session	NR	NR	NR	Fluency of English language, no history of cerebrovascular disease, closed head injury associated with loss of consciousness > 15 minutes, psychiatric illness, or drug or alcohol abuse	Participants attended a familiarisation session 1 week prior to baseline assessment and performed an abbreviated version of the neurocognitive tests
Barnes et al., 2004 ⁸²	NR	Clinically significant depression was present in 40% of the OSAS participants (as measured by the BDI)	NR	NR	Fluency of English language, no history of cerebrovascular disease, closed head injury associated with loss of consciousness > 15 minutes, psychiatric illness, or drug or alcohol abuse	Participants attended a familiarisation session 1 week prior to baseline assessment and performed an abbreviated version of the neurocognitive tests
Cibele et al., 2006 ⁷²	NR	NR	NR	NR	NR	NR
Bardwell et al., 2000 ¹¹⁷	Tests were administered early afternoon	NR	NR	NR	No major illness other than OSA, hypertension medication tapered before participation	Alternate forms were used for the word fluency test (considered to be the most likely test to show a learning effect)
Engleman et al., 1994 ⁹⁰	Cognitive function was assessed in between MSLT naps across the course of a day	Participants were asked to avoid caffeine-containing drinks before attending assessments and were offered only decaffeinated drinks during the assessment day	Tests were conducted on the last day of each treatment period and were administered in a standardised order at the same time of day	NR	NR	Participants attended a familiarisation session with the psychometric battery prior to baseline assessment. Alternate forms of two neurocognitive tests were used at follow-up assessment

Table 54 Test procedures for neurocognitive trials

Study	Time of day	Caffeine/medication	Test order	Environment	Special exclusion criteria	Test-retest
Engleman <i>et al.</i> , 1997 ⁹²	Assessments were conducted throughout the day	NR	Tests were conducted on the last day of each treatment period and were administered in a standardised order	NR	Individuals with co-existing neurological disorders were excluded	Participants attended a familiarisation session with the psychometric battery prior to baseline assessment. Alternate forms of two neurocognitive tests were used at follow-up assessment
Engleman <i>et al.</i> , 1998 ⁹³	NR	NR	Tests were administered in a standardised order	NR	Individuals with co-existing neurological disorders were excluded	NR
Engleman <i>et al.</i> , 1999 ⁷⁸	Afternoon, during 'post-lunch dip' in performance	NR	Tests were administered in a standardised order	NR	NR	Participants attended a familiarisation session with the psychometric battery prior to baseline assessment
Engleman <i>et al.</i> , 2002 ¹⁰³	NR	NR	NR	NR	NR	NR
Henke <i>et al.</i> , 2001 ⁸⁵	Tests were administered between 2 p.m. and 6 p.m.	NR	NR	NR	NR	Participants attended a familiarisation session with the psychometric battery prior to baseline assessment. Four parallel test packets were administered on a randomised counterbalanced schedule
Hoekema <i>et al.</i> , 2006 ^{102,114}	Between noon and 2 p.m.	Participants were instructed to avoid stimulating products, such as caffeine, up to 3 hours before testing and not to smoke in the 30 minutes before testing	The test was administered at the same time of day in subsequent sessions	Room conditions: lights were dimmed, noise was excluded, and room temperature was kept at 22 °C. Participants were alone during testing	Individuals without a driving licence, or who were involved in shift work or night-time work, were excluded	A practice session immediately prior to baseline assessment was provided

continued

Study	Time of day	Caffeine/medication	Test order	Environment	Special exclusion criteria	Test-retest
Jenkinson <i>et al.</i> , 1999 ^{77,118}	Three 30-minute drives (11 a.m., 12 p.m. and 2 p.m.)	NR	The tests were performed at the same time of day on each occasion	NR	Individuals considered too mentally impaired to provide reliable informed consent were excluded	An initial training drive was administered prior to the first drive on each day
Jokic <i>et al.</i> , 1999 ¹⁰⁸	Cognitive tests were administered after the third MSLT test, which was conducted 2 hours after waking and given at 2-hourly intervals	Participants were asked to avoid caffeine-containing drinks before attending assessments and were offered only decaffeinated drinks during the assessment day. A urine toxicology screen was performed on day 15 of each study limb for use of any drugs that might affect sleep quality or daytime function	Each test was administered at the same time of day on each study limb. The order was balanced throughout the study	NR	NR	Participants attended a familiarisation session with the psychometric tests prior to baseline assessment
Lojander <i>et al.</i> , 1999 ¹¹³	Tests were performed in the morning	NR	NR	NR	Individuals with other diseases and daytime hypoxaemia were excluded	NR
Marshall <i>et al.</i> , 2005 ⁷⁹	PVT was administered twice a day with a 1-minute practice session before each 10-minute data collection session at 2.30 p.m. and 4.30 p.m. on each of the four study days (beginning and end of each treatment period)	NR	Testing procedures were time of day fixed	NR	Individuals who performed shift work, had extreme somnolence requiring immediate treatment, had a chronic sleep restriction, were taking sedatives, had an alcohol intake > 3 standard units/24 hours or had a caffeine dependency were excluded	NR

Table 54 Test procedures for neurocognitive trials

Study	Time of day	Caffeine/medication	Test order	Environment	Special exclusion criteria	Test-retest
Monasterio <i>et al.</i> , 2001 ¹⁰⁰	Tests were administered at 9 a.m.	NR	Testing procedures were administered at the same time each session	NR	Individuals with hazardous jobs (drivers or those handling dangerous machinery), with conditions that might affect cognition or quality of life (severe neurological disease, psychiatric disease, severe chronic disease or illiteracy) were excluded	NR
Norman <i>et al.</i> , 2006 ^{73,341}	Tests were administered at 1 p.m.	NR	NR	NR	Individuals were excluded if they had a history of heart, liver or renal disease, diabetes, psychosis, narcolepsy, current drug or alcohol abuse, severe asthma or cerebrovascular disease, were pregnant, or were taking prescription medications except hypertensive medication. Those taking hypertensive medication underwent a 3-week washout period before study entry	Employed alternate forms for tests

BDI, Beck Depression Inventory; MSLT, Multiple Sleep Latency Test; NAB, neuropsychological assessment battery; NC, neurocognitive; NR, not reported; OSA, obstructive sleep apnoea; OSAHS, obstructive sleep apnoea-hypopnoea syndrome; PVT, Psychomotor Vigilance Test.

Outcomes were measured at baseline and at 9 weeks: daytime MAP, night-time MAP, ESS, AHI, REM (%), minimum SaO₂. BP was measured using a cuff (recording time was limited to 20 hours). During the diagnostic period participants spent 7.2 hours in bed; night-time BP was calculated for this time period. Daytime BP was recorded for the remaining 12 hours.</p>		Total	CPAP	Comparator	Age		54.4 (SD 8.9)	52.3 (SD 8.4)	Sex	Male ($n = 29$), female ($n = 3$)	Male ($n = 15$), female ($n = 1$)	Male ($n = 14$), female ($n = 2$)	AHI		62.5 (SD 17.8)	65.0 (SD 26.7)	ESS		14.4 (SD 2.5)	14.1 (SD 3.2)	BMI		33.3 (SD 5.1)	33.5 (SD 6.0)	BP				24-Hour BP		100.4 (SD 15.9)	99.5 (SD 12.3)	24-Hour SBP		135.9 (SD 17.5)	136.2 (SD 13.1)	24-Hour DBP		83.4 (SD 15.9)	81.1 (SD 12.3)	Daytime BP		103.6 (SD 16.1)	103.5 (SD 12.1)	Daytime SBP		140.1 (SD 17.6)	141.0 (SD 13.8)	Daytime DBP		86.4 (SD 16.1)	85.4 (SD 12.3)	Night-time BP		96.2 (SD 17.6)	93.6 (SD 15.2)	Night-time SBP		129.9 (SD 20.0)	129.2 (SD 16.9)	Night-time DBP		79.1 (SD 17.0)	75.4 (SD 15.2)

Economic evaluation data extraction

	Ayas et al., 2006¹²²	Mar et al., 2003¹²³
Type of economic evaluation	Cost–utility analysis	Cost–utility analysis
Currency used, year	US\$, 2003	Euros (converted from Spanish pesetas), 2000
Study design	Markov model using effectiveness estimates from one study and adjusting these for the impact of RTAs, based on a random-effects meta-analysis of eight before and after studies	Semi-Markov model using effectiveness estimates from a before and after study
Perspective	Third-party payer. Societal perspective	Health-care perspective
Participants	Data from 99 patients with moderate to severe OSAHS were used to establish the proportion of patients in each sex/age group	Based on a cohort of 5000 patients with moderate to severe OSAS to establish the proportion of patients in each sex/age group
Setting, country of study	US	Spain
Intervention group	CPAP	nCPAP
Control group	No CPAP	No CPAP
Resources used	Health care; costs of diagnosis and treatment of OSAHS, costs attributable to motor vehicle accidents and maintenance costs of the devices and costs of medical follow-up	Health care; costs of investigation, diagnosis and treatment of OSAS, costs attributable to CVE morbidity and maintenance costs of the devices and costs of medical follow-up
Source of effectiveness data	Base case used single study (Chakravorty et al., 2002 ⁹⁷). For patients who had an RTA, utility estimates were adjusted using the FCI	Survey of OSAS patients before the initiation of CPAP and 3 months post CPAP
Length of follow-up	5 years	Results were extrapolated to 5 years and over the lifespan of the patient
Source of resource use data	A primary referral centre and national data. Not all sources of resource use data were reported	Single sleep centre located in a hospital
Source of unit cost data	The cost of CPAP was obtained from Medicare fee schedules. Costs of RTAs were obtained from the National Highway Traffic Safety Administration	The device cost was the price of the CPAP S VI Plus model. Regional hospital costs were used for the health-care costs
Link between cost and effectiveness data	Cost and effectiveness data were not linked directly	Cost and effectiveness data were not linked directly
Clinical outcomes measured and methods of valuation used	The base case used a single study (Chakravorty et al., 2002 ⁹⁷) to obtain the relative treatment effect of CPAP vs do nothing. The utilities were elicited using patient preferences and were valued using the standard gamble. For the secondary analysis, EQ-5D estimates were used based on societal preferences (Jenkinson et al., 1998 ³⁴⁹ and Mar et al., 2003 ¹²³). For patients who had an RTA, utility estimates were adjusted using rating scale preference weights obtained from the FCI (Graham et al., 1997 ¹⁴³)	Utility values were obtained using the EQ-5D. The health states for 46 patients were elicited and societal preferences were applied using the time trade-off technique No data were available on quality of life in OSAS patients with stroke and CHD; therefore this was modelled by assigning quality adjustment factors of 0.8 and 0.9 respectively to these health states, based on an estimate in the published literature

CPAP (auto); no CPAP	Dental devices; no CPAP
Health care; costs of investigation, titration, diagnosis and treatment of OSAHS, costs attributable to CVE and RTA morbidity and maintenance costs of the devices and costs of medical follow-up	Health care; costs of investigation, diagnosis and treatment of OSAHS and maintenance costs of the devices and costs of medical follow-up
Base case used Mar et al., 2003 ¹²³ results	Three studies (Waterhouse et al., 2000 ^{150,151} and Jenkinson et al., 1999 ⁷⁷) using before and after (up to 4 weeks) initiation of CPAP Jenkinson, 1999 ⁷⁷
14 years. Used results of Marin et al., 2005 ¹³⁰ and Mar et al., 2003 ¹²³ to calculate annual incidence of fatal and non-fatal CVE and cerebrovascular events in CPAP-treated and untreated patients with severe OSAHS (AHI \geq 30) to 12 years and extrapolated these results over another 2 years. Used the Mar et al., 2003 ¹²³ results to estimate the ratio of CHD and stroke in patients with untreated severe OSAHS as 1.185 and 1.353 respectively. Estimated the ratio of developing CHD to stroke as 1 : 1.13. Estimated ratio of CHD to stroke in treated patients as 1 : 1. Using these estimates, ResMed calculated the annual risk of CVE and stroke	5 years
19 clinicians	Published literature, administrative database and clinical opinion
List prices, published literature, government statistics	Published literature, administrative database and clinical opinion
Cost and effectiveness data were not linked directly	Cost and effectiveness data were not linked directly
Utility values were obtained from the EQ-5D using the Mar et al., 2003 ¹²³ results. The health states for 46 patients were elicited and societal preferences were applied using the time trade-off technique	Utility values generated via SF-36 survey, using the Brazier et al., 1998 ¹⁴⁸ algorithm. Societal preferences were applied using the TTO and/or standard gamble
No data were available on quality of life in OSAHS patients with stroke and CHD; therefore this was modelled by assigning quality adjustment factors of 0.8 and 0.9 respectively to these health states, based on an estimate in the published literature. To estimate utility associated with a non-fatal RTA, ResMed took the average utility for OSAHS and a non-fatal CVE in treated and untreated patients

A series of univariate and multivariate sensitivity analyses were conducted as reported in <i>Table 20</i>	A series of univariate sensitivity analyses were conducted on impact of analytical time horizon, costs of investigation for nCPAP, long-term costs of maintenance, follow-up and other health-care resource usage, long-term impact of gross annual health-care costs, potential impact of improved mortality from use of nCPAP treatment, impact of uncertainty in morbidity benefits from nCPAP therapy and discount rate
Yes	Not undertaken
CPAP (fixed) dominates no treatment and CPAP (auto) dominates no treatment after a minimum of 2 years' treatment. Based on current evidence, use of CPAP (auto) is associated with marginally better outcomes and no additional cost compared with CPAP (fixed)	Treatment for OSAHS with CPAP has a cost-effectiveness in line with that of other commonly funded treatments. The incremental cost-effectiveness of nCPAP over dental devices was likely to be highly uncertain

Appendix 7

Review of utility data

The approach recommended by the National Institute for Health and Clinical Excellence (NICE) and other bodies, when undertaking cost-effectiveness analyses, is to measure the incremental cost per quality-adjusted life-year (QALY) gained of the intervention under study versus an appropriate comparator. QALYs are calculated by multiplying the amount of time spent in a health outcome by the preference value or utility attached to that outcome. This latter quality adjustment is based on a set of values or weights for each possible health state that reflect the relative desirability of that health state as judged by individuals or society. In the case of cost-effectiveness studies of CPAP, utility values are required that quantify the impact on HRQoL of experiencing sleep apnoea and also the influence of receiving CPAP therapy on HRQoL. This report reviews the clinical and cost-effectiveness literature on CPAP and sleep apnoea in order to identify possible utility values for the economic analysis.

A search was undertaken of the MEDLINE database in order to identify relevant literature. The search strategy identified 160 abstracts. Abstracts were screened by one reviewer (SvH) and copies of those that were considered relevant were obtained. Four papers were identified as containing potentially relevant HRQoL/utility data. These are appraised below with respect to their utility data.

Tousignant et al., 1994¹²⁴

This study assessed the impact of nCPAP therapy on the quality of life of 19 patients with sleep apnoea.

Patients attending a hospital sleep clinic (mean age 57 years, SD 10), who had been receiving nCPAP treatment for an average of 9 months, completed a standard gamble exercise. The health states valued were receiving treatment for nCPAP, pre-treatment, full health and immediate death. To assess the reliability of the results patients completed the exercise on two occasions 2–3 weeks apart. The mean utility score for the pre-treatment health state was 0.63 (0.29) and the mean utility score for the nCPAP treatment health state was 0.87 (0.17). The intraclass correlation coefficients for the retest data

were above 0.7 for both the treatment health state and the pre-treatment health state.

Comments

As all the patients were currently receiving nCPAP therapy, the valuation of their pre-treatment health state was done retrospectively. Given this, it is difficult to ascertain the extent to which the difference in pre-treatment and treatment utility scores is a real difference, reflecting the impact of nCPAP treatment and the extent to which it demonstrates some sort of measurement error due to bias in recall.

Jenkinson et al., 1997¹⁵²

This study compared the performance of three commonly used quality of life measures [SF-36, EQ-5D and the Functional Limitations Profile (FLP)] in patients with sleep apnoea before and after nCPAP therapy and compared the data with those for a normal population.

One hundred and eight male patients (mean age 50 years, SD 10) with a mean baseline ESS of 14 (SD 5) attending a sleep clinic for a therapeutic assessment of nCPAP therapy completed the three HRQoL measures before and 5 weeks after commencing treatment.

At baseline the mean EQ-5D index score was 0.79 (0.21) and after treatment the score had increased to 0.84 (0.25), which was not statistically significant and indicates only minor benefits from nCPAP therapy. In contrast, both SF-36 and the FLP showed statistically significant improvements in scores on the majority of their dimensions. The authors suggest that the failure of EQ-5D to show a similar magnitude of change to the other measures may be because it does not contain questions that specifically address areas of health thought to be affected by sleep apnoea such as sleep, tiredness, energy and social functioning. With this in mind, they caution the use of measures such as EQ-5D when evaluating therapy in this area.

Comments

Unlike the SF-36 and FLP, EQ-5D does not contain dimensions relating to sleep and/or vitality,

which undoubtedly are of importance in this area; however, its usual activities dimension does arguably measure aspects of social functioning. If the intention were to measure change in sleepiness or tiredness then EQ-5D would not be the first choice. However, if the intention is to measure change in overall HRQoL then EQ-5D is a well-validated, globally used measure that, unlike the other two measures, generates a score that is weighted by the values of the general population. The EQ-5D index score is the main output of interest to those who require a score for use in decisions relating to resource allocation. However, within the context of this paper, it is not clear why the authors restrict their assessment of the performance of EQ-5D to the performance of the EQ-5D index score alone and appear to disregard the EQ-5D visual analogue scale score or, indeed, the score on the five dimension questions separately.

Chakravorty et al., 2002⁹⁷

This study compared the effectiveness of CPAP therapy with a conservative lifestyle management as assessed using two different methods for eliciting health utilities (EQ-5D and a standard gamble task).

Seventy-one patients referred to a hospital sleep clinic with a history of snoring and excessive daytime sleepiness were recruited to the study and randomised to receive either CPAP therapy or lifestyle management. Each treatment phase lasted for 3 months. Prior to randomisation and at the end of treatment patients completed EQ-5D and a standard gamble task in which they were asked whether they would choose to stay in their current state of health or receive treatment leading to one of two outcomes: either complete cure or failure leading to a worst health state/death.

Standard gamble scores showed a mean gain of 0.23 (from 0.32 to 0.55) for the CPAP group compared with a gain of 0.04 (from 0.31 to 0.35) for the lifestyle group. In comparison, EQ-5D index scores showed a much smaller mean gain of 0.04 (from 0.73 to 0.77) for the CPAP group and no change for the lifestyle group. Both groups showed significant improvements in their ESS score, and the CPAP group but not the lifestyle group also showed significant improvement in their AHI score.

The authors suggest that the results indicate that EQ-5D may not be an appropriate instrument to

use among patients with sleep apnoea because it only showed a mild change in patients with an effective positive treatment response to CPAP, and failed to record the small improvement seen in the lifestyle group (as measured using standard gamble). However, it should be noted that the lifestyle group did not show significant improvement in terms of the objective polysomnographic measures reported in the study.

Comments

EQ-5D scores were relatively high at baseline and were similar to those reported in other studies for this patient group.

It is not surprising that the utility values obtained using the two methods are different as they were elicited by means of completely different questions. Given this, the authors' conclusions about EQ-5D appear to be somewhat unwarranted.

Comparing utility values elicited using two different methods is problematic; the authors appear to treat the utilities elicited using the standard gamble approach as the 'gold standard' but their justifications for doing so in this context, other than describing the standard gamble approach as the 'classical approach to calculating utilities', are unclear.

Mar et al., 2003¹²³

This paper aimed to analyse the long-term cost-effectiveness of nCPAP treatment in patients with moderate to severe obstructive sleep apnoea in comparison with conventional treatment.

The authors undertook a survey to obtain EQ-5D utility values for patients with sleep apnoea. Forty-six patients referred to a hospital sleep unit were recruited and interviewed twice, once before commencing treatment and again after using nCPAP for 3 months. The mean age of the sample was 53 years (SD 12), 87% were male and their mean ESS was 13.8 (SD 5.8). Before starting nCPAP the mean EQ-5D index score for the sample was 0.738 (0.646–0.829); 3 months later the mean gain was 0.073 (0.015–0.131). Utilities for non-fatal stroke and non-fatal CHD also included in the model were obtained from the literature but were not specific to patients with sleep apnoea.

Comments

EQ-5D utility values were chosen as the study was designed to consider CPAP within the context of resource allocation; in addition EQ-5D has been

validated in a Spanish population.¹²⁴ Improvement was similar to that reported in the study by Jenkinson *et al.*, 1997¹⁵² (see above) which used EQ-5D in a similar population. However, the authors point out that the lack of a control group

is a limitation of most studies that measure utility values in patients with sleep apnoea, and warn that the improvement in HRQoL observed may be an overestimation due to the placebo effect.

Appendix 8

Bivariate random-effects meta-analysis in WinBUGS

The randomised controlled trials identified in the systematic review reported a range of outcomes that were potentially relevant to the appraisal of CPAP for the treatment of OSAHS. In Chapter 3 a separate univariate meta-analysis was performed for each outcome of interest (where there were sufficient data from comparable studies). An alternative approach would be to perform a multivariate meta-analysis to jointly calculate pooled estimates for each outcome. By performing a multivariate meta-analysis the correlation between outcomes can be estimated and incorporated. Under a univariate approach, outcomes that are not reported are assumed to be missing completely at random (MCAR) and the between-study correlation between treatment effects on different outcomes is assumed to be zero. Using the multivariate approach, outcomes that are not reported are assumed to be missing at random (MAR), with the mechanism for missingness informed by the between-study correlation and the treatment effects for those outcomes that are reported.

Two outcomes identified in the systematic review were selected to inform the York economic model: mean difference in ESS score and mean difference in SBP. A random-effects analysis was performed in both the univariate and bivariate meta-analysis approaches, where each study's summary statistics [ess_i ($essVar_i$), bp_i ($bpVar_i$)] were assumed to represent an estimate of different underlying true values ($essMu_i$, $bpMu_i$), and these underlying true values were assumed to be drawn from a distribution with a particular mean ($essReMu$, $bpReMu$) and variance ($essReVar$, $bpReVar$). The framework for the bivariate approach is as follows:

$$\begin{pmatrix} \frac{ess_i}{bp_i} \end{pmatrix} \sim N \left(\begin{pmatrix} \frac{essMu_i}{bpMu_i} \end{pmatrix}, \delta_i \right), \delta_i = \begin{pmatrix} \frac{essVar_i}{\phi_i essVar_i} & \frac{essVar_i}{bpVar_i} \end{pmatrix}$$

$$\begin{pmatrix} \frac{essMu_i}{bpMu_i} \end{pmatrix} \sim N \left(\begin{pmatrix} \frac{essReMu}{bpReMu} \end{pmatrix}, \Omega_i \right), \Omega_i = \begin{pmatrix} \frac{essReVar_i}{\Phi_{essReVar_i}} & \frac{\Phi_{essReVar}}{bpReVar} \end{pmatrix}$$

where $\phi_i essVar_i$ is the within-study covariance and $\Phi_{essReVar}$ is the between-study covariance. None of the trials reported within-study covariance between mean difference in ESS and mean difference in SBP, and so a set of patient-level data containing both outcomes was obtained from which an informative prior could be specified. In addition, owing to the small number of studies reporting both outcomes when incorporating only SBP measured by ABPM, an informative prior was specified for the variance ($essVar_i$, $bpVar_i$) to be used where studies did not report one of the outcomes of interest. This prior was specified by multiplying the variance by the sample size, with a crude adjustment for the study design (i.e. doubling the sample size for crossover studies).

A product-normal approach was used to specify the model to estimate the effect of CPAP compared with conservative management on ESS score and SBP. The WinBUGS code for the model and the data sets used in the analyses are presented below. The output from 10,000 iterations was used to inform the York economic model after discarding the first 50,000 iterations.

Feedback

The HTA Programme and the authors would like to know your views about this report.

The Correspondence Page on the HTA website (www.hta.ac.uk) is a convenient way to publish your comments. If you prefer, you can send your comments to the address below, telling us whether you would like us to transfer them to the website.

We look forward to hearing from you.
