Plain English summary

Bleeding can occur as a result of surgery or injury, or because of problems with the blood clotting process. Patients with bleeding usually require a blood transfusion and/or (re)-operation, both of which may lead to increased illness and death. It is important to appropriately treat the cause of the bleed and reduce the blood loss. ROTEM (ROTEM® Delta, TEM International GmbH, Munich, Germany; www.rotem.de), thromboelastography (TEG® 5000 analyser, Haemonetics Corporation, Niles, IL, USA; www.haemonetics.com) and Sonoclot (Sonoclot® coagulation and platelet function analyser, Sienco Inc., Arvada, CO, USA) are ‘viscoelastic’ (VE) methods developed to monitor the clotting process. They are performed near the patient and can help differentiate between abnormal bleeding (due to surgery) and a clotting disorder. VE testing methods offer two key potential benefits over standard laboratory tests (SLTs): they provide results in a shorter timescale and provide the additional information on the clotting process. This means requirements for specific blood products can be targeted and so the patient is not subjected to risks associated with unnecessary transfusion.

This assessment aimed to determine the effectiveness of VE devices to assist with the assessment of clotting disorders during and after cardiac surgery or trauma; we also planned to include information on the management of excessive bleeding post childbirth but there was insufficient evidence. We found that VE testing using ROTEM or TEG may be effective in reducing the numbers of cardiac surgery patients receiving blood product transfusion. We did not find any studies on the clinical effectiveness of Sonoclot or on the clinical effectiveness of any VE device in trauma patients. Cost-effectiveness analyses indicated that VE testing was cost-saving and more effective than SLTs in both patients undergoing cardiac surgery and trauma patients.
Criteria for inclusion in the Health Technology Assessment journal

Reports are published in Health Technology Assessment (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in Health Technology Assessment are termed ‘systematic’ when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme

The HTA programme, part of the National Institute for Health Research (NIHR), was set up in 1993. It produces high-quality research information on the effectiveness, costs and broader impact of health technologies for those who use, manage and provide care in the NHS. ‘Health technologies’ are broadly defined as all interventions used to promote health, prevent and treat disease, and improve rehabilitation and long-term care.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

For more information about the HTA programme please visit the website: http://www.nets.nihr.ac.uk/programmes/hta

This report

The research reported in this issue of the journal was commissioned and funded by the HTA programme on behalf of NICE as project number 13/38/01. The protocol was agreed in August 2013. The assessment report began editorial review in February 2014 and was accepted for publication in August 2014. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health.
