Plain English summary

Chronic obstructive pulmonary disease is a lung condition usually caused by smoking. It is a mixture of bronchitis (airway damage) and emphysema (damage to the lung tissue itself). In emphysema, the lungs become baggy and full of holes, which makes it impossible to breathe out fully. This is called ‘gas trapping’. A fibreoptic camera (bronchoscope) can be used to place valves into the airways of the lung. The valves stop air entering the most damaged part of the lung, which makes more space for the remaining healthier lung to function.

Unfortunately, in many patients, lung destruction breaks down the barriers (fissures) between the lobes of the lung. This allows air to get round behind the valves so the treatment does not work. The valves are expensive, so to get the best value from the treatment we need to be able to pick people who will benefit accurately.

We carefully selected 50 patients with severe emphysema whose fissures looked to be intact on computerised tomography scan. Half had valves placed and half did not. Patients and investigators did not know which group they were in. After 3 months, lung function and exercise capacity had improved significantly in the treated group but not in the control group. Two people in the treatment group died before 3 months and one of the control patients was too unwell for further measurements to be made.

This suggests that valve treatment is effective in carefully selected patients with emphysema.
Criteria for inclusion in the Efficacy and Mechanism Evaluation journal

Reports are published in Efficacy and Mechanism Evaluation (EME) if (1) they have resulted from work for the EME programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

EME programme

The Efficacy and Mechanism Evaluation (EME) programme was set up in 2008 as part of the National Institute for Health Research (NIHR) and the Medical Research Council (MRC) coordinated strategy for clinical trials. The EME programme is broadly aimed at supporting ‘science driven’ studies with an expectation of substantial health gain and aims to support excellent clinical science with an ultimate view to improving health or patient care.

Its remit includes evaluations of new treatments, including therapeutics (small molecule and biologic), psychological interventions, public health, diagnostics and medical devices. Treatments or interventions intended to prevent disease are also included.

The EME programme supports laboratory based or similar studies that are embedded within the main study if relevant to the remit of the EME programme. Studies that use validated surrogate markers as indicators of health outcome are also considered.

For more information about the EME programme please visit the website: http://www.nets.nihr.ac.uk/programmes/eme

This report

The research reported in this issue of the journal was funded by the EME programme as project number 10/90/10. The contractual start date was in February 2012. The final report began editorial review in March 2014 and was accepted for publication in March 2015. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The EME editors and production house have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the final report document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research. The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, MRC, NETSCC, the EME programme or the Department of Health. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the EME programme or the Department of Health.
