Plain English summary

Patient safety remains a health policy priority. Despite advances in research and policy, studies continue to find worryingly routine levels of patient harm. This study focuses on the threats to patient safety associated with hospital discharge. It suggests that hospital discharge is a highly complex process involving multiple clinicians and stakeholders, operating in various settings. The quality and safety of these interactions can be related to the extent of knowledge sharing between stakeholders; where stakeholders openly share knowledge, they can better co-ordinate their work and reduce the complexity of hospital discharge. This study aims to identify interventions and practices that support knowledge sharing across care settings and thus promote safe hospital discharge by mitigating system complexity.

The study shows how hospital discharge does not occur as a single or isolated event, but rather through a complex series of situations and opportunities for knowledge sharing. However, these situations vary according to a number of key factors, such as the range of people involved, the types of resources they have access to and the level of leadership. The study also shows that stakeholders perceive a wide range of threats to safe discharge associated with falls, medicines, infection, clinical procedures, equipment, timing and scheduling, and communication. Drawing upon this research evidence, the report develops lessons for policy-makers and service leaders to support knowledge sharing, especially between health and social care agencies, and thereby mitigate system complexity and promote discharge safety.
The Health Services and Delivery Research (HS&DR) programme, part of the National Institute for Health Research (NIHR), was established to fund a broad range of research. It combines the strengths and contributions of two previous NIHR research programmes: the Health Services Research (HSR) programme and the Service Delivery and Organisation (SDO) programme, which were merged in January 2012.

The HS&DR programme aims to produce rigorous and relevant evidence on the quality, access and organisation of health services including costs and outcomes, as well as research on implementation. The programme will enhance the strategic focus on research that matters to the NHS and is keen to support ambitious evaluative research to improve health services.

For more information about the HS&DR programme please visit the website: http://www.nets.nihr.ac.uk/programmes/hsdr

This report
The research reported in this issue of the journal was funded by the HS&DR programme or one of its proceeding programmes as project number 10/1007/01. The contractual start date was in June 2011. The final report began editorial review in June 2013 and was accepted for publication in November 2013. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HS&DR editors and production house have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the final report document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HS&DR programme or the Department of Health. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HS&DR programme or the Department of Health.
