Plain English summary

Molecular testing for Lynch syndrome in people with colorectal cancer
Health Technology Assessment 2017; Vol. 21: No. 51
DOI: 10.3310/hta21510

NIHR Journals Library www.journalslibrary.nihr.ac.uk
The DNA mismatch repair system corrects errors in DNA replication that occur when cells in the body divide. Without the mismatch repair system, errors in DNA multiply and this can lead to cancer developing, especially in the bowel and in the female reproductive organs.

Most people are born with two working copies of the genes responsible for the mismatch repair system, but some people inherit a faulty (mutated) copy of one of the genes. As they have only one working copy they are more likely to lose the function in the mismatch repair system and subsequently develop cancer. This leads to patterns of cancer in a family, which is known as Lynch syndrome.

Around two in five people with Lynch syndrome will develop bowel cancer during their lifetime and around one in three women with Lynch syndrome will develop womb cancer. People with Lynch syndrome are also more likely to develop ovarian cancer and a number of other cancers.

The aim of this study was to find out whether it would be clinically effective (i.e. good for patients and their families) and cost-effective (i.e. a good use of limited NHS resources) to screen bowel cancer patients for Lynch syndrome by testing their tumours. If tests on the tumours show signs of Lynch syndrome they can be offered genetic testing to search for the mutated gene responsible. Family members can then be offered a blood test to see if they have the mutated gene. The benefit of knowing that someone has Lynch syndrome is that surveillance can be offered, such as colonoscopy, to reduce the risk of cancer in the future.

Published evidence shows that tumour tests can help to identify Lynch syndrome. Although it has not been proven in practice, a mathematical model suggests that screening would be clinically effective and cost-effective.
Criteria for inclusion in the Health Technology Assessment journal

Reports are published in Health Technology Assessment (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in Health Technology Assessment are termed ‘systematic’ when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme

The HTA programme, part of the National Institute for Health Research (NIHR), was set up in 1993. It produces high-quality research information on the effectiveness, costs and broader impact of health technologies for those who use, manage and provide care in the NHS. ‘Health technologies’ are broadly defined as all interventions used to promote health, prevent and treat disease, and improve rehabilitation and long-term care.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

For more information about the HTA programme please visit the website: http://www.nets.nihr.ac.uk/programmes/hta

This report

The research reported in this issue of the journal was commissioned and funded by the HTA programme on behalf of NICE as project number 15/17/04. The protocol was agreed in January 2016. The assessment report began editorial review in September 2016 and was accepted for publication in March 2017. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health.
