Plain English summary

Background

There is uncertainty as to the value of medical devices that are commonly used in the diagnosis and treatment of anaemia and coagulopathy.

Aim

To assess the clinical benefits and cost-effectiveness of devices in common use for the diagnosis and treatment of cardiac surgery patients with anaemia and coagulopathy.

Methods and results

We demonstrated that bedside (near-patient) diagnostic tests for coagulopathy in common clinical use, or a panel of specific laboratory diagnostic tests, were not superior to using clinical data available at baseline to predict severe bleeding. Further analyses showed that these tests did not improve clinical outcomes and were not cost-effective.

In a multicentre trial we demonstrated that the use of near-infrared spectroscopy as a patient-specific indicator of the need for transfusion was no better than standard care (no near-infrared spectroscopy measurement) and was not cost-effective. A review of all of the existing trials of this technology in cardiac surgery yielded similar results.

In a multicentre trial we failed to demonstrate any benefit of mechanical washing of red cells, a technique that is thought to remove harmful substances known to accumulate in blood when it is stored in the blood bank.

Conclusions

Our programme of work did not support the use of medical devices in clinical use for the diagnosis and treatment of anaemia and coagulopathy. This work highlights the importance of the careful evaluation of devices in clinical trials prior to marketing and supports calls for the revision of regulatory processes for device approval.

Criteria for inclusion in the Programme Grants for Applied Research journal

Reports are published in Programme Grants for Applied Research (PGfAR) if (1) they have resulted from work for the PGfAR programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Programme Grants for Applied Research programme

The Programme Grants for Applied Research (PGfAR) programme, part of the National Institute for Health Research (NIHR), was set up in 2006 to produce independent research findings that will have practical application for the benefit of patients and the NHS in the relatively near future. The Programme is managed by the NIHR Central Commissioning Facility (CCF) with strategic input from the Programme Director.

The programme is a national response mode funding scheme that aims to provide evidence to improve health outcomes in England through promotion of health, prevention of ill health, and optimal disease management (including safety and quality), with particular emphasis on conditions causing significant disease burden.

For more information about the PGfAR programme please visit the website: http://www.nihr.ac.uk/funding/programme-grants-for-applied-research.htm

This report

The research reported in this issue of the journal was funded by PGfAR as project number RP-PG-0407-10384. The contractual start date was in July 2008. The final report began editorial review in July 2016 and was accepted for publication in April 2017. As the funder, the PGfAR programme agreed the research questions and study designs in advance with the investigators. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The PGfAR editors and production house have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the final report document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, CCF, NETSCC, PGfAR or the Department of Health. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the PGfAR programme or the Department of Health.
