**Declared competing interests of authors:** Samer Nashef received personal expenses from AtriCure, Inc. (Amsterdam, the Netherlands) for contributing to educational courses for surgeons interested in learning the maze procedure, independently of this study. AtriCure, Inc. is one of several manufacturers of atrial fibrillation ablation devices, the technology of which was used in atrial fibrillation surgery in this study.

## Plain English summary

Irregular heartbeat is common, and the most common type is atrial fibrillation (AF). The heart has four chambers: two ventricles that propel blood from the heart and two atria that receive blood. In AF, the chambers of the heart lose their pumping action and the heart becomes less efficient. Blood can settle in the atria and form clots. These can detach and cause strokes, so AF patients are given blood-thinning drugs to reduce this risk. These drugs can increase the risk of bleeding. The maze procedure is an operation designed to stop AF and make the heart beat regularly again.

Many patients who need major heart surgery also have AF. The Amaze trial was designed to find out whether or not adding a maze procedure to heart operations is useful in making the heartbeat regular again, if it improves long-term survival and quality of life (QoL) and whether or not any benefits are worth the extra costs.

Between 25 February 2009 and 6 March 2014, 352 patients in 11 hospitals were recruited and randomly put into one of two treatment groups: (1) maze and planned heart surgery or (2) planned surgery alone. The results showed that patients in the maze group were more likely to have a normal, regular heartbeat afterwards; however, there were no differences in survival or QoL at 2 years. In addition, many maze patients who recovered a regular heartbeat did well in terms of the heart's pumping action, suggesting that longer follow-up may show better QoL and survival in these patients.

## Criteria for inclusion in the *Health Technology Assessment* journal

Reports are published in *Health Technology Assessment* (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in *Health Technology Assessment* are termed 'systematic' when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

## HTA programme

The HTA programme, part of the National Institute for Health Research (NIHR), was set up in 1993. It produces high-quality research information on the effectiveness, costs and broader impact of health technologies for those who use, manage and provide care in the NHS. 'Health technologies' are broadly defined as all interventions used to promote health, prevent and treat disease, and improve rehabilitation and long-term care.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

For more information about the HTA programme please visit the website: <http://www.nets.nhr.ac.uk/programmes/hta>

## This report

The research reported in this issue of the journal was funded by the HTA programme as project number 07/01/34. The contractual start date was in September 2008. The draft report began editorial review in January 2017 and was accepted for publication in August 2017. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care.
