Plain English summary

Dementia is a progressive brain disease for which there is currently no cure. The disease reduces the ability to plan thoughts and movements, make decisions and remember things. People with dementia can feel confused, disorientated and frightened. Many live with the diagnosis for years in the community and, ultimately, may require nursing care. The causes of the disease are complex and not fully understood. However, research over the last 10 years suggests that exercise may help, as it improves blood flow to the brain and releases chemicals from muscles. To see if this is so, we asked nearly 500 people with dementia and their carers to join this research study. We tracked the thinking abilities of people with dementia, as well as their independence, body functioning, mental health and enjoyment of life. We also looked at the costs of all the health and social services they used. We asked two-thirds of the people with dementia to try out a new exercise programme, which included 4 months of face-to-face sessions that involved going to a group class twice a week and trying to do more exercise at home. Participants then tried to carry on the exercise programme at home for 8 months with some support provided by physiotherapists. We tracked nearly all of the people who signed up for the trial. Two-thirds of those who asked to go to the exercise classes attended the majority of sessions. One-third of the people did not complete the exercise classes. The results showed that people enjoyed the exercise classes and that very frail people managed to join in. Physical fitness and muscle strength improved. However, body functioning, mental health and enjoyment in life were no different from the group who did not take the exercise programme. Thinking abilities were a little worse in the group who did the exercise.

Criteria for inclusion in the Health Technology Assessment journal
Reports are published in Health Technology Assessment (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in Health Technology Assessment are termed ‘systematic’ when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme
The HTA programme, part of the National Institute for Health Research (NIHR), was set up in 1993. It produces high-quality research information on the effectiveness, costs and broader impact of health technologies for those who use, manage and provide care in the NHS. ‘Health technologies’ are broadly defined as all interventions used to promote health, prevent and treat disease, and improve rehabilitation and long-term care.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

For more information about the HTA programme please visit the website: http://www.nets.nihr.ac.uk/programmes/hta

This report
The research reported in this issue of the journal was funded by the HTA programme as project number 09/80/04. The contractual start date was in April 2012. The draft report began editorial review in April 2017 and was accepted for publication in September 2017. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors’ report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care.
