Plain English summary

A blood clot in the lung is a potentially fatal complication of pregnancy that can be difficult to diagnose. Symptoms that suggest a blood clot, such as chest pain or breathlessness, are common in pregnancy. Diagnosis usually requires a scan that involves giving a small dose of radiation to the mother and possibly to the baby.

A clinical decision rule uses information from the woman's medical history and examination to estimate the risk that she has a blood clot. Blood tests that are abnormal in people with blood clots can perform a similar role. We wanted to find out whether or not clinical decision rules or blood tests could be used to decide which women with a suspected blood clot should have a scan.

We collected information from 181 pregnant or recently pregnant women with blood clots in their lungs and 259 women without blood clots who had been investigated in hospital for a suspected blood clot. We also collected blood samples from 36 women with blood clots in their lungs or legs, and 247 with no blood clot. We found that the blood clots were very difficult to diagnose without a scan. None of the clinical decision rules or blood tests was able to reliably determine which women had a blood clot. The economic analysis showed that scanning every woman with a suspected blood clot was a worthwhile use of NHS resources. This is because the risks of scanning are very small, whereas the benefits of detecting and treating blood clots are very large.

Clinical decision rules and blood tests should not be used to select which women with a suspected blood clot in pregnancy have a scan. Future research needs to develop new ways of diagnosing blood clots in pregnancy.

Criteria for inclusion in the *Health Technology Assessment* journal

Reports are published in *Health Technology Assessment* (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in *Health Technology Assessment* are termed 'systematic' when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme

The HTA programme, part of the National Institute for Health Research (NIHR), was set up in 1993. It produces high-quality research information on the effectiveness, costs and broader impact of health technologies for those who use, manage and provide care in the NHS. 'Health technologies' are broadly defined as all interventions used to promote health, prevent and treat disease, and improve rehabilitation and long-term care.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

For more information about the HTA programme please visit the website: <http://www.nets.nihr.ac.uk/programmes/hta>

This report

The research reported in this issue of the journal was funded by the HTA programme as project number 13/21/01. The contractual start date was in October 2014. The draft report began editorial review in June 2017 and was accepted for publication in November 2017. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care.
