Declared competing interests of authors: Anthony Gordon reports personal fees and non-financial support from Orion Corporation Orion Pharma, and grants and other from Tenax Therapeutics during the conduct of the study. He also reports personal fees from Ferring Pharmaceuticals, grants from HCA International, personal fees from GlaxoSmithKline plc, personal fees from Baxter Healthcare Ltd and personal fees from Amomed Pharma outside the submitted work. Daniel McAuley reports personal fees from Peptinnovate Ltd, Bayer, Boehringer Ingelheim Ltd and SOBI, personal fees and other from GlaxoSmithKline plc and grants from the National Institute for Health Research (NIHR), Wellcome Trust and other funders outside the submitted work, as well as a patent being issued for the novel treatment for acute respiratory distress syndrome outside the submitted work. Daniel McAuley is a member of the Health Technology Assessment (HTA) General Board. Mervyn Singer reports grants from the NIHR during the conduct of the study and personal fees from Amomed Pharma outside the submitted work. Anthony Gordon, Gavin Perkins and Daniel McAuley are directors of research for the Intensive Care Foundation.

Plain English summary

Septic shock is a common life-threatening condition. It occurs when infection causes blood pressure to fall to dangerous levels, reducing blood flow to vital organs. Adrenaline-like drugs are commonly used to improve a patient’s blood pressure, but they can have serious side effects. Levosimendan is a new type of drug that works in a different way from adrenaline-like drugs, potentially avoiding these side effects.

The LeoPARDS (Levosimendan for the Prevention of Acute oRgan Dysfunction in Sepsis) trial investigated whether or not using levosimendan to treat patients who had septic shock improved the function of different organs and improved recovery.

Patients who had septic shock were randomised to receive a 24-hour infusion of levosimendan or placebo, in addition to standard care. Patients were followed up daily for up to 28 days and then at 6 months. A total of 2382 patients were assessed and, of these, 516 patients from 34 intensive care units across the UK took part in the trial from January 2014 to December 2015.

Levosimendan did not improve organ function or any other outcomes when added to standard care in septic shock. Levosimendan is known to dilate blood vessels and this might improve the blood supply to various organs. However, in patients receiving levosimendan, higher doses of adrenaline-like drugs had to be given to maintain blood pressure because of the dilatation of the blood vessels. The patients then had a faster heart rate and more irregular heartbeats. In addition, those patients who required help with breathing from a ventilator required this support for longer.

We cannot recommend the use of levosimendan to treat routine cases of septic shock. Although it is disappointing that this study has not shown a benefit from using levosimendan in sepsis, it has still provided useful information. Knowing when not to use drugs is important to reduce the risk of side effects and to avoid wasting precious resources.
Efficacy and Mechanism Evaluation

Criteria for inclusion in the Efficacy and Mechanism Evaluation journal
Reports are published in Efficacy and Mechanism Evaluation (EME) if (1) they have resulted from work for the EME programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

EME programme
The Efficacy and Mechanism Evaluation (EME) programme was set up in 2008 as part of the National Institute for Health Research (NIHR) and the Medical Research Council (MRC) coordinated strategy for clinical trials. The EME programme is broadly aimed at supporting 'science driven' studies with an expectation of substantial health gain and aims to support excellent clinical science with an ultimate view to improving health or patient care.

Its remit includes evaluations of new treatments, including therapeutics (small molecule and biologic), psychological interventions, public health, diagnostics and medical devices. Treatments or interventions intended to prevent disease are also included.

The EME programme supports laboratory based or similar studies that are embedded within the main study if relevant to the remit of the EME programme. Studies that use validated surrogate markers as indicators of health outcome are also considered.

For more information about the EME programme please visit the website: http://www.nets.nihr.ac.uk/programmes/eme

This report
The research reported in this issue of the journal was funded by the EME programme as project number 11/14/08. The contractual start date was in July 2013. The final report began editorial review in July 2017 and was accepted for publication in June 2018. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The EME editors and production house have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the final report document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research. The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, the MRC, NETSCC, the EME programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the EME programme or the Department of Health and Social Care.
