Plain English summary

In England, NHS Health Checks aim to prevent cardiovascular diseases, such as heart attack and stroke. Health checks are conducted in primary care by a health-care assistant or practice nurse, who should measure the patient's risk of cardiovascular disease before advising them on how to reduce their risk. Cardiovascular disease risk is measured using a cardiovascular disease risk calculator. These calculators use various patient characteristics (e.g. age, sex, blood pressure and cholesterol) to predict how likely patients are to have a heart attack or stroke in the future.

The aim of this study was to compare how practitioners explain cardiovascular disease risk to patients during health checks when using two risk calculators: QRISK[®]2, which measures the risk of heart attack or stroke over the next 10 years (current usual practice), and JBS3 (a newer risk calculator), which gives this risk across the lifetime, is more interactive and has various visual displays of risk. We were interested to see if using JBS3 in health checks would lead to better practitioner and patient understanding of cardiovascular disease risk and result in patients intending to change, or actually changing, their behaviour to reduce their cardiovascular disease risk (compared with QRISK2).

Health checks were video-recorded: 73 using QRISK2 and 100 using JBS3. Patients and members of the public advised on the study design, methods and management. Most consultations lasted < 20 minutes, with most time spent discussing the causes of cardiovascular disease. There was evidence that, compared with health checks using JBS3, those using QRISK2 led to less discussion of risk and practitioners speaking far more than patients. Sixty-four health checks from each risk calculator group were examined in depth. Opportunities to check whether or not patients understood the cardiovascular disease risk information and to encourage ways to lower risk were missed, making it less likely that patients would change their behaviour. The way that risk is presented by JBS3 seems to be more easily understood by patients than that presented by QRISK2.

Nineteen patients in the QRISK2 group and 21 patients in the JBS3 group were interviewed 4 weeks after the consultation, and the practitioners were interviewed after they had completed all of their health checks. Patients found it difficult to understand and remember what they had been told about their cardiovascular disease risk during their health check. Their understanding and motivation to change behaviour appeared to be higher when they were visually shown how behaviour changes could lower their risk. Practitioners sometimes misunderstood risk and used patients' reactions to judge whether or not they understood, rather than asking them.

Our findings should help to improve how cardiovascular disease risk is communicated during health checks in future, through simple changes to the consultations (e.g. using aspects of JBS3) and by highlighting a gap in practitioners' training.

Criteria for inclusion in the *Health Technology Assessment* journal

Reports are published in *Health Technology Assessment* (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in *Health Technology Assessment* are termed 'systematic' when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme

Health Technology Assessment (HTA) research is undertaken where some evidence already exists to show that a technology can be effective and this needs to be compared to the current standard intervention to see which works best. Research can evaluate any intervention used in the treatment, prevention or diagnosis of disease, provided the study outcomes lead to findings that have the potential to be of direct benefit to NHS patients. Technologies in this context mean any method used to promote health; prevent and treat disease; and improve rehabilitation or long-term care. They are not confined to new drugs and include any intervention used in the treatment, prevention or diagnosis of disease.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

This report

The research reported in this issue of the journal was funded by the HTA programme as project number 15/170/02. The contractual start date was in March 2017. The draft report began editorial review in July 2020 and was accepted for publication in December 2020. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care.
