Plain English summary

Background

Reliable access to the blood circulation is essential for patients receiving haemodialysis. Surgical connection of an artery and vein in the arm (i.e. an arteriovenous fistula) is the preferred option, but the veins in these fistulas are prone to developing narrowed segments that affect their function. These narrowings are treated with a balloon inserted into the vein under X-ray guidance. However, the narrow segments often recur after this treatment. Paclitaxel is a drug used to treat cancer. Balloons coated with paclitaxel have been developed to allow deposition of the drug in the blood vessel at the time of treatment without significant absorption of the drug into other parts of the body. The PAVE (Paclitaxel-assisted balloon Angioplasty of Venous stenosis in haEmodialysis access) trial was conceived after a number of small studies suggested that recurrence of the narrowing may be reduced by these paclitaxel-coated balloons. We designed an investigator-led multicentre randomised controlled trial with a variable follow-up time, but with a minimum of 1 year, to assess the efficacy of paclitaxel-coated angioplasty balloons in prolonging the survival time of target lesion primary patency in arteriovenous fistulas.

Methods

We included 212 patients with an arteriovenous fistula that was not working properly and who were referred for a balloon treatment. We included patients with a single narrowed segment only; patients with complicating features, such as the presence of synthetic tubes that join the blood vessels or a narrowing in the larger veins towards the heart, were not included. Patients had the balloon treatment that they would have had even if they were not in the trial. After this, if they had a successful treatment and remained eligible, they were randomised. A web-based system was used to randomly allocate them to additional treatment with a paclitaxel-coated or a standard balloon. Patients were then followed up to see if there was a difference between the two groups to assess the effect of the paclitaxel-coated balloon.

Results

The main measure of success for the trial was the time taken until there was a need to re-treat the same narrow segment with another balloon or operation. If the fistula was abandoned or became blocked because of recurrence at the same segment, then this also meant that the treatment had failed. At the end of the study, there was no evidence of a difference between the groups for this main outcome measure. In addition, we looked at a number of other measures, including the time until treatment was needed in the fistula, even if this was in a different place from the initial treatment, and the time until the fistula was abandoned for any reason. Again, no evidence of any differences was seen. There was also no evidence of differences in adverse events.

Conclusion

There was no evidence of differences in any of the outcomes. The treatment of arteriovenous fistulas, used for haemodialysis, with paclitaxel-coated balloons does not provide a benefit.

Criteria for inclusion in the *Efficacy and Mechanism Evaluation* journal

Reports are published in *Efficacy and Mechanism Evaluation* (EME) if (1) they have resulted from work for the EME programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

EME programme

The Efficacy and Mechanism Evaluation (EME) programme funds ambitious studies evaluating interventions that have the potential to make a step-change in the promotion of health, treatment of disease and improvement of rehabilitation or long-term care. Within these studies, EME supports research to improve the understanding of the mechanisms of both diseases and treatments.

The programme supports translational research into a wide range of new or repurposed interventions. These may include diagnostic or prognostic tests and decision-making tools, therapeutics or psychological treatments, medical devices, and public health initiatives delivered in the NHS.

The EME programme supports clinical trials and studies with other robust designs, which test the efficacy of interventions, and which may use clinical or well-validated surrogate outcomes. It only supports studies in man and where there is adequate proof of concept. The programme encourages hypothesis-driven mechanistic studies, integrated within the efficacy study, that explore the mechanisms of action of the intervention or the disease, the cause of differing responses, or improve the understanding of adverse effects. It funds similar mechanistic studies linked to studies funded by any NIHR programme.

The EME programme is funded by the Medical Research Council (MRC) and the National Institute for Health Research (NIHR), with contributions from the Chief Scientist Office (CSO) in Scotland and National Institute for Social Care and Health Research (NISCHR) in Wales and the Health and Social Care Research and Development (HSC R&D), Public Health Agency in Northern Ireland.

This report

The research reported in this issue of the journal was funded by the EME programme as project number 13/94/10. The contractual start date was in May 2015. The final report began editorial review in December 2020 and was accepted for publication in July 2021. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The EME editors and production house have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the final report document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research. The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, the MRC, NETSCC, the EME programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the EME programme or the Department of Health and Social Care.
