Declared competing interests of authors: Simon Gilbody reports serving on a number of funding committees: Health Technology Assessment (HTA) Efficient Study Designs 2 (2015–16), HTA End of Life Care and Add-on Studies (2014–16), HTA Funding Committee Policy Group (formerly CSG) (2017–20), HTA Clinical Evaluation and Trials Committee (2008–14), and HTA Commissioning Committee (2016–20). Tony Kendrick reports grants from the National Institute for Health Research (NIHR) during the conduct of the study. Glyn Lewis reports grants from University College London during the conduct of the study; personal fees from Fortitude Law (London, UK), outside the submitted work; and being a member of the Efficacy and Mechanism Evaluation Funding Committee (2011–16). Michael Moore reports grants from NIHR during the conduct of the study. Irwin Nazareth reports, as director of PRIMENT Clinical Trials Unit, core support funds from NIHR (that will be provided until 31 August 2022) for the Clinical Trials Unit, and was a member of the HTA Commissioning Sub-Board (2009–17), the HTA Primary Care Themed Call board (2013–14) and the HTA Commissioning Committee (2010–17).

Plain English summary

Antidepressants are used to treat depression when someone is unwell, but are also used as maintenance treatment to prevent the reoccurrence of depression. There has been a large increase in the use of long-term maintenance antidepressant treatment, but the evidence for the benefits of maintenance beyond 8 months is very poor.

The ANTidepressants to prevent reLapse in dEpReSSION (ANTLER) trial was a randomised controlled trial that examined the effectiveness of long-term maintenance treatment with antidepressants. The participants were well enough to consider stopping antidepressant medication, were recruited from primary care and had taken antidepressants for ≥ 9 months. In total, 238 participants were randomised to continue taking antidepressants and 240 were randomised to receive a visually identical tablet that contained no active ingredients after a period when the antidepressants were gradually reduced. Neither the participants nor those interviewing them knew which group they had been placed in, and they were followed up for 1 year.

Participants who discontinued antidepressants were more likely to experience relapse than those who continued antidepressants. By 52 weeks, 39% of those who continued antidepressants had experienced a relapse, compared with 56% in the group that discontinued antidepressants. In other words, over a 52-week period, one in every six patients who stopped antidepressants would experience a relapse that may not have occurred if they had remained on their antidepressants. Patients in the discontinuation group reported more symptoms of anxiety and depression and experienced more withdrawal symptoms than those in the maintenance group, mostly in the first 3–4 months after stopping the antidepressants. Participants in the discontinuation group also reported lower quality of life than those in the maintenance group but both groups used similar amounts of health-care and social care resources over the 12-month period. About one-third of participants who were allocated to the discontinuation group in the ANTLER trial decided to restart their antidepressants. However, another one-third of participants in that group remained on trial medication for 12 months and managed without antidepressants.

Long-term maintenance treatment with antidepressants is effective in reducing the rate of relapses. For those who are considering stopping their antidepressant, our findings will provide estimates of the likely benefits and harms, to improve shared decision-making and support the regular review of long-term antidepressant prescription.

Criteria for inclusion in the *Health Technology Assessment* journal

Reports are published in *Health Technology Assessment* (HTA) if (1) they have resulted from work for the HTA programme, and (2) they are of a sufficiently high scientific quality as assessed by the reviewers and editors.

Reviews in *Health Technology Assessment* are termed 'systematic' when the account of the search appraisal and synthesis methods (to minimise biases and random errors) would, in theory, permit the replication of the review by others.

HTA programme

Health Technology Assessment (HTA) research is undertaken where some evidence already exists to show that a technology can be effective and this needs to be compared to the current standard intervention to see which works best. Research can evaluate any intervention used in the treatment, prevention or diagnosis of disease, provided the study outcomes lead to findings that have the potential to be of direct benefit to NHS patients. Technologies in this context mean any method used to promote health; prevent and treat disease; and improve rehabilitation or long-term care. They are not confined to new drugs and include any intervention used in the treatment, prevention or diagnosis of disease.

The journal is indexed in NHS Evidence via its abstracts included in MEDLINE and its Technology Assessment Reports inform National Institute for Health and Care Excellence (NICE) guidance. HTA research is also an important source of evidence for National Screening Committee (NSC) policy decisions.

This report

The research reported in this issue of the journal was funded by the HTA programme as project number 13/115/48. The contractual start date was in May 2016. The draft report began editorial review in November 2020 and was accepted for publication in July 2021. The authors have been wholly responsible for all data collection, analysis and interpretation, and for writing up their work. The HTA editors and publisher have tried to ensure the accuracy of the authors' report and would like to thank the reviewers for their constructive comments on the draft document. However, they do not accept liability for damages or losses arising from material published in this report.

This report presents independent research funded by the National Institute for Health Research (NIHR). The views and opinions expressed by authors in this publication are those of the authors and do not necessarily reflect those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care. If there are verbatim quotations included in this publication the views and opinions expressed by the interviewees are those of the interviewees and do not necessarily reflect those of the authors, those of the NHS, the NIHR, NETSCC, the HTA programme or the Department of Health and Social Care.
